

A short laboratory report

Ahmad Youssef · PSYCH 302 / 305 · 23 September 2026

Question

Which personality characteristics did the inventory measure?

Prediction

I predicted that conscientiousness would be one of my higher-scoring personality domains, with a mean around 3–4.

Results

The table and figure below are written by `scripts/summarize.py`. Do not type the mean here.

File `inventory-week03.csv`: $n = 10$ usable values of inventory item scores (column scored). Mean = 3.00, SD = 1.15. 0 row(s) excluded; scores outside 1–5 were excluded.

Statistic	Value
n	10
Mean	3.00
SD	1.15
Excluded	0

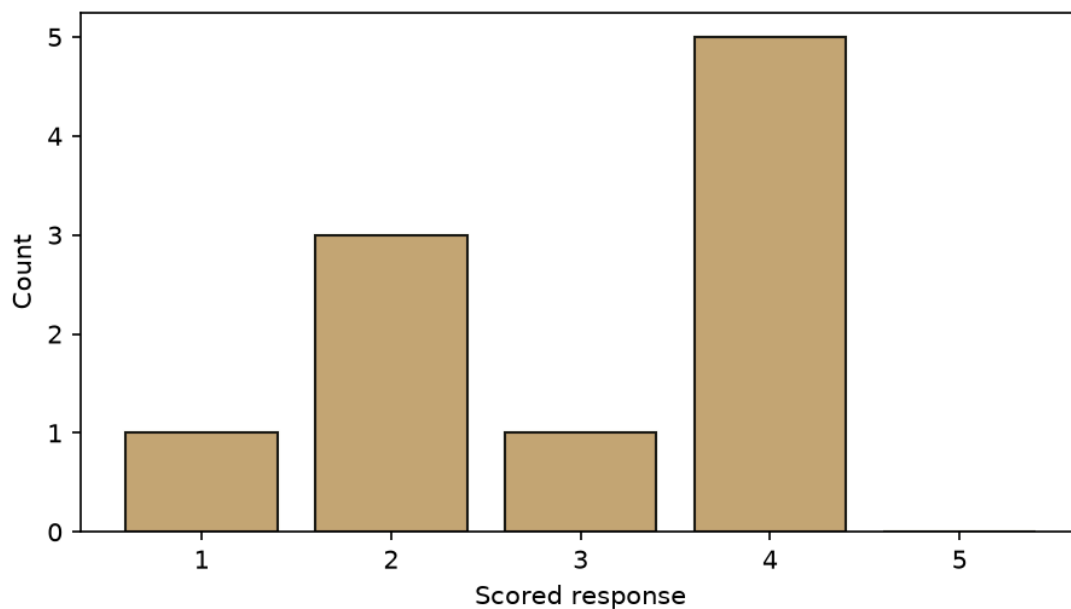

Figure 1: Counts of usable inventory item scores after reverse scoring.

Limitation

Because this was a self-report inventory, my responses may have been influenced by social desirability.
